

Basic Patterns and Graphs Practice #4

1. a) Plot lines on the graph opposite for the situation where:

- Bill rides his bike for two hours at 25 km per hour.
- He rests for one hour.
- He rides back to the start at 20 km per hour.

- b) How long is it in total before Bill returns to the start position?
- c) What is the average speed of the runner whose distance vs time is shown on the graph?

2. a) For the pattern shown to the left, complete the table below:

x	0	1	2	3	4	5	...	10
y								

- b) Give the equation of that pattern:
- c) On the same grid, plot the line $y = 5 - x$

3. The graph below shows the temperature in an office building during a working day:

- a) When is the heating turned on in the morning?
- b) When is the office heating up at its fastest rate?
- a) How fast is the temperature dropping at 15:00?

Answers: Basic Patterns and Graphs Practice #4

1. a) Plot lines on the graph opposite for the situation where:
- Bill rides his bike for two hours at 25 km per hour.
 - He rests for one hour.
 - He rides back to the start at 20 km per hour.

- b) How long is it in total before Bill returns to the start position? **5.5 hours**
- c) What is the average speed of the runner whose whose distance vs time is shown on the graph? **8 km/hr** (40 km in 5 hours – dotted line)

2. a) For the pattern shown to the left, complete the table below:

x	0	1	2	3	4	5	...	10
y	1	3	5	7	9	11		21

- b) Give the equation of that pattern: **$y = 2x + 1$**

- c) On the same grid, plot the line $y = 5 - x$ **shown**

3. The graph below shows the temperature in an office building during a working day:

- a) When is the heating turned on in the morning? **6:30 a.m.**
- b) When is the office heating up at its fastest rate? **7:30 a.m.** (when graph is steepest)
- a) How fast is the temperature dropping at 15:00? **2.5 degrees an hour** (7.5 in 3 hrs)
